

Thermal springs in Aachen

The town of Aachen, also known as Bad Aachen, is located in Germany close to the borders with Belgium and the Netherlands. Since Roman times, this city is known as spa town. Till today, thermal water is produced at several fountains and springs, and used in bath infrastructure.

Anomalies

A broad range of temperatures between 20 and 72.2 °C has been observed for the Aachen spring water, depending on the spring and the moment of measurement (Hänel, 2020; Herch, 2000; Käß and Käß, 2008; Michel, 1997; Wikipedia, 2008). In most cases, the temperature decreases over the years, often related to over-exploitation. Nevertheless, these springs clearly classify as thermal springs ($T > 12$ °C, the maximum temperature expected for spring water). The Aachen springs thus form a significant anomaly, even though they are located outside the Rhine graben and topography-driven fluid flow solely cannot explain the occurrence of these geomanifestations. The thermal springs south of Aachen are linked to the Variscan Burtscheider thrust fault, while those in the city center (indicated with * in the table below) are linked to the Variscan Aachener thrust fault. In both cases, the extent of anomaly in temperature, as well as in geochemistry, increases closer to the NNW-SSE Rhine graben faults (Herch, 2000). The springs for which CO₂-data are available mostly don't show an anomalous CO₂-content, although systematic data lacks (Käß and Käß, 2008; Michel, 1997).
