

CO₂-rich groundwater in Bad Peterstal-Griesbach

Bad Peterstal-Griesbach is a small town in SW Germany. Its groundwater is mineral- and CO₂-rich, officially classified as Heilwasser, and used in various healing treatments (Hänel, 2020).

Anomalies

Analyses of the water in Bad Peterstal-Griesbach ($n = 39$) show CO₂-concentrations of at least 350 mg/l, and on average 1860 mg/l (Käβ and Käβ, 2008). This is in all cases above the threshold value of 250 mg/l to be classified as Sauerbrunnen (Weertz and Weertz, 2007). A maximum temperature of 20 °C is observed, and about one third of the temperature observations (10 of 27) are higher than 12°C (Käβ and Käβ, 2008), the maximum temperature expected for shallow groundwater, indicating the slightly thermal anomalous nature of the water.

In Bad Peterstal-Griesbach, meteoric water infiltrates in disturbed zones of the "Grundgebirge" and circulates at quite shallow levels through joints and fissures. The fault zone central in the valley, along which CO₂ from the nearby degassing volcanic field could rise, is thought responsible for the enriched CO₂-signature of the groundwater (Käβ & Käβ, 2008).
