

CO₂-seepage in Bad Schwalbach

Bad Schwalbach is since long famous for its mineral- and CO₂-rich springs and groundwater. CO₂-seepage is also expressed by the presence of the Brodelbrunnen mofette (a dry CO₂-spring).

Anomalies

Apart from the Brodelbrunnen mofette, the CO₂-concentrations of ground- and spring water in Bad Schwalbach vary between 1192 and 2790 mg/l (Hänel, 2020; Käβ and Käβ, 2008), i.e. up to ten times the threshold value of 250 mg/l to be classified as Säuerling (Weertz and Weertz, 2007). The occurrence of CO₂-rich water in Bad Schwalbach is not related to Variscan tectonics and faults. Rather, it is associated with extensive, younger N-S (W-dipping) and E-W (S-dipping) fault systems occurring in the "Hunsrückschiefer" lithology. These formed as consequence of the plate tectonic activity associated to the formation of the Oberrheingraben and its extension in the Taunus plateau. The creation of these young faults allows upper mantle CO₂ to migrate towards the surface and be dissolved in the circulating groundwater. In contrast to the Eifel area, young volcanic phenomena are absent in the area of Bad Schwalbach (Käβ and Käβ, 2008).
